No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     contig of 5824 bp in length gap of unknown length contig of 436 bp in length gap of unknown length contig of 3535 bp in length gap of unknown length contig of 5410 bp in length

cancer including of diagnosis and treatment ü nse for proliferation sarcomas of hi

protein (WAR-1). The invention includes rat and human WAR-1 sequences, expression vectors containing the DNA, cells transformed with the expression vector, antibodies against WAR-1, and probes and primers which hybridise to the DNA encoding WAR-1. The WAR-1 protein inhibits the proliferation of cancer cells, and is used in the treatment and diagnosis of cancers including highly malignant sarcomas. ö 120 180 180 240 240 300 300 360 360 540 420 420 480 480 540 900 Gaps 900 99 099 720 780 9 9 gtctcctgcgtgggcatgttcttcgtgctgggacttatgttcgagggcacggcgagatg. agagagagagagagagagagagagagagagagagagagaaatttgatttccacagcatca gctccttaagggaaggtgagattcctaagagatcagtagagagcaccagggagctcgctg ctgtgttgctatggtgatgatggcaatggtaatgacagtggcaccagatttccctgttcc aacgccaggaacccccggtgctgagccacgaattcatggtgcagaaccacgcggatatg ctgcgaccctgggcggcagacgggcggggatggggagcccggcgctgggagcgcagt ctgcgaccctgggcggcagacgggcggggatggggagcccggcgctgggagcgcgcagt gtctcctgcgtgggcatgttcttcgtgctgggacttatgttcgagggcacggccgagatg agactgcagctcaccaaaggcaaacaaaacaaattgaatgaggccgggcagctgagtgtg ctggtggccatcatcatcacgccaccattcaggagtacgtgctagataagctcagccgg Length Indels other; 21; 0; T; 0 DB 602 Score 2311; Pred. The present invention describes a screening method for secretory and membrane proteins consisting of transformation of a cell with separate expression vectors for the sense and antisense RNA of DNA encoding an endoplasmic reticulum membrane protein participating in endoplasmic reticulum membrane proteins. Also described are: (1) secretory and cell membrane proteins; dantified by the screening method; (2) drug compositions containing these proteins; (3) host cells transformed by the separate expression vectors of the method; and (4) the preparation of secretory and cell membrane proteins; (3) host cells transformed by the separate expression vectors of the method; and (4) the preparation of secretory and cell membrane proteins by culture of the transformants. The method can be used for the identification and preparation of proteins for use in the treatment and prevention of diseases such as cancer, disorders of the nervous system, immune disorders (including encodes a specifically claimed rat WAR-1 protein from the present

This sequence represents the DNA encoding an endoplasmic reticulum protein (WAR-1). The invention includes rat and human WAR-1 sequences, expression vectors containing the DNA, cells transformed with the expression vector, antibodies against WAR-1, and probes and primers which publicate to the DNA encoding WAR-1. The WAR-1 protein inhibits the proliferation of cancer cells, and is used in the treatment and diagnosis of cancers including highly malignant sarcomas.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The colynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving to restore normal activity of (II) or to treat disease states involving antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human clarge and polymer of the invention.

The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a full length human of the full length when the construction of the full length construction of the full length construction of the full length when the construction of the full length construction of the construction of the full length construction of the const
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.

Transformation of a cell with separate vectors expressing the sense and antisense strands of WAR-1 DNA for screening secretory and membrane proteins expressed by the cell

Example 1; Page 68-71; 79pp; Japanese.

The present invention describes a screening method for secretory and membrane proteins consisting of transformation of a cell with separate expression vectors for the sense and antisense RNA of DNA encoding an endoplasmic reticulum membrane protein participating in endoplasmic reticulum transport of proteins. Also described are: (1) secretory and cell membrane proteins identified by the screening method; (2) drug compositions containing these proteins; (3) host cells transformed by the separate expression vectors of the method; and (4) the preparation of secretory and cell membrane proteins by culture of the transformants. The method can be used for the identification and preparation of proteins for use in the treatment and prevention of diseases such as cancer, disorders of the nervous system, immune disorders (including allergies and rheumatism) and skeletral disorders. The present sequence

The present invention describes a screening method for secretory and membrane proteins consisting of transformation of a cell with separate expression vectors for the sense and antisense RNA of DNA encoding an endoplasmic reticulum membrane protein participating in endoplasmic reticulum transport of proteins. Also described are: (1) secretory and cell membrane proteins identified by the screening method; (2) drug compositions containing these proteins; (3) host cells transformed by the separate expression vectors of the method; and (4) the preparation of secretory and cell membrane proteins by culture of the transformants. The method can be used for the identification and preparation of proteins for use in the treatment and prevention of diseases such as cancer, disorders of the nervous system, immune disorders (including allergies and rheumatism) and skeletal disorders. The present sequence

AAC77607 to AAC78448 encode the human cancer associated proteins given in AAB43398 to AAB4239. The proteins can have activities based on the tissues and cells the genes are expressed in. Example of activities include: cytostatic; proliferative; vulnerary; immunomodulator; antidiabetic; antiasthmatic; antialregic; antiathmatic; antiallergic; antiathritic; antidiabetic; antiasthmatic; antiallergic; antiathritic; antiathritic; antiathritic; antiathritic; antiathritic; antiathritic; antiathritic; antiathritic; caqulant; nootropic; vasotropic; antipsoriatic and antiangiogenic. The polynucleotides and polypeptides can be used for preventing, treating or ameliorating medical conditions and diagnosing pathological conditions. Polynucleotides, polypeptides, antibodies, agonists and antagonists from the present invention may be used to treat immune disorders by activating for inhibiting the proliferation, differentiation or mobilisation of immune cells, to treat disorders of haematopoietic cells, autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      disorders, allergic reactions, graft versus host disease and organ rejection, modulate haemostatic or thrombolytic activity, modulate inflammation, cancers, cardiovascular disorders, neurological disease and bacterial or viral infections. The peptides, nucleotides, autibodies, agonists and antagonists may be also be used in drug screens. AAC78449 to AAC78457 and AAB44240 represent sequences used in the exemplification of

                                                                                                                                                                                                                                                                                                                                immunodeficiency (SCID)), autoimmune disorders (e.g. multiple sclerosis), blood disorders (e.g. thrombocytopaenia), inflammatory disorders (e.g. arthritis) and infectious disorders (e.g. hepatitis). The polynucleotide sequences of the invention are also useful in gene therapy. AAS62214-AAS62838 represent the CDNA sequences of the
                                                                                                                                                                    The present invention relates to the isolation of novel CDNA sequences which encode human secreted proteins. The CDNA sequences have been derived from a variety of human tissues. The invention also provides a method for producing proteins from these polynuclectide sequences. The proteins are useful for identifying compounds that modulate their activity and production, and the cell is also useful for identifying compounds that modulate expression of the polynuclectide sequences encoding the secreted proteins. The sequences of the invention are useful for treating diseases such as hyperproliferative disorders

The invention relates to a novel human translocating chain associating membrane protein (BioTRAM), polynucleotides encoding this polypeptide and the recombination process used to produce the polypeptide. The present invention also discloses the method of applying the polypeptide and polynucleotides in treating immunological disorder, malignant tumour, cancer and other diseases. The antagonist resisting the polypeptide and its treatment effect is also disclosed. Diagnosis and determination method based on the discrimination of the mutation in the nucleic acid sequence and the change in the polypeptide expression level, and the application of the plypeptide expression level, and the sequence represents the coding sequence of the novel human BioTRAM protein as described in the invention.
             New human transposition chain related membrane protein and its coding
                                                                                                                                                                                                                                                                                                                                   cDNA encoding human translocating chain-associated membrane protein.
                                                                                                                                                                                                                                                                                                                                                                 translocating chain-associated membrane protein; BioTRAM; ss.

This invention describes novel nucleic acid sequences (A) that are expressed at high level in normal prostatic tissue. Polypeptides (I) perioded by (A) are used. (a) for identifying agents for treatment of prostatic cancer and (b) for therapy of prostate cancer, optionally where expressed by gene therapy methods. (A) is also used to isolate (II)-length genes (for gene therapy) and for recombinant production of (I), which can be used to raise specific antibodies. (A) are identified by assembly of ESTS (expressed sequence tags) before these are analyzed for expression pattern (tissue specificity). This approach eliminates many of the false results, as regards tissue specificity, associated with known methods that use single (usually short) ESTS. AA23347-Z33540 represent expressed sequence tags described in the method of the
